Is there a God in cyberspace?

The internet is creating an environment in which everybody is connected throughout the world. There are 7.5 billion people in the world; of these 60.3% are living in Asia, 14.5% is in Africa, and only .5% folks are in North America. Cyberspace is a digital world where everyone is connected. This cyberspace is a new frontier: There is no FBI, nor having police, but only a wild frontier without having law and not having a God: wild and lawless frontier.

As of today about 88% of North American residences are connected but only 27% of African and 46% of Asians have access to the cyberspace. Through this cyberspace we buy and sell the goods and services, communicate one another, browse information, coordinate project, collaborate each other free from the geographical and time restriction. Through this cyberspace people cheat, rob and kill others. Individual is empowered to do a devilish work or do a good deed. The cyberspace can be vicious, wild and destructive frontier without having a God. At the same time the cyberspace can be a place where God's will be done at the earth as it is in Heaven.

The positive side of having the cyberspace is, through his cyberspace, we can harness resources in the earth as well as beyond the earth for human well-being; we can eradicate dieses and sickness; we can get rid of hunger and poverty; can build utopian community and perpetuate peace and joy.

Negative side of cyberspace is destructiveness. Through cyberspace many traditional jobs are being eliminated with an application of Artificial Intelligence, expert systems, big data analytics. The convergence of Robotics, Genetic, Biotic and Artificial Intelligence is rapidly reshaping a way in which we live.

The cyberspace has changed our daily life. I wake up in the early morning. My wife asks Alexa, Voice recognition gadget known as Amazon Echo system.

Alexa, what today's weather in our area?

What should I wear? What is our calendar events today?

Alexa briefs weather and the calendar events. My wife ask again, Alexa, call XYZ restaurant and order the three bentos to be delivered at 12:00 today Call the Uber.

The Alexa is voice recognition soft bot acts as our household assistant. The Alexa will be improved its function to provide all of household chores; conversational needs; controlling household gadget such as put lights on and off; control room temperature; sending our physical fitness information to our primary doctors. The Alexa is all we need for assisting seniors independent living: No more care giver.

I get the work downloaded for my writings. I get pension and social security benefits deposited into my banking accounts; I talk and interact with my friends in Korea and Hawaii via video Kakao talks. We see and talk as if they are in the next door. I also conduct collaborate research with my colleagues. Whenever I need to refresh a certain subject, I get video lectures via Khan Academy. The cyberspace provides all of my needs without going through a physical labor and movement.

On the other hands, this cyberspace provide killing fields for terrorists; through three dimensional instruction, a terrorist can easily assembe bombs, IED(improvised explosive device), or killing devices through cyberspace. Terrorists can easily execute killing through a network of suicide bombers. Through cyberspace battalion of cyber hackers, like North Korean Special army, disrupt and attack their chosen enemy's infrastructures. Acceleration and malicious adaptation of technologies, no doubt, will destroy the civilization as we know of today.

Where is a God in cyberspace?

Internet revolutionized the market place and supply chains. Amazon destroyed and replaced retail market, Uber is building the biggest taxi company without owning a single vehicle. Internet of things is being revolutionize manufacturing industry. Knowledge imbedded internet is collaborating advancement of and application of Knowledge. The cyberspace is rapidly changing our life and our civilization.

The digital frontier created a world in which human beings are totally empowered and becoming more God like. More and more people are asking about values and humanity in their own ways, and wondering whether God is governing the cyberspace. As we increase our powers in the cyberspace, we are asking ourselves, Is there a God in the cyberspace?

The God is what we believe and what we witness. If we create and worship the God in the cyberspace, we will create "Thy will be don earth as it is in Heaven". Otherwise we die, we destroy ourselves: No more human civilizations.
